PROFILE

Experienced Frontend Developer focused on FinTech and AI products, with over four years of experience. I specialize in complex financial systems: MLOps platforms, credit origination pipelines, biometric identity verification. I build custom UI component libraries, carefully designed for seamless integration and user convenience. Working with Figma, I communicate effectively with stakeholders and design architectures that fully match project goals and user requirements. Open to remote work on Moscow (MSK) hours and relocation to Russia.

SKILLS

- Agile/Scrum, Problem solving, Design Thinking, Responsive Design
- HTML, CSS Preprocessors, JavaScript, TypeScript, React 19, Next.js 14 (App Router), TanStack Query, TanStack Router, Zustand, Redux Toolkit, React Hook Form, Zod, Axios, Web Sockets, Tailwind CSS, SCSS Modules, Material UI, Ant Design, Radix UI, Vite, Webpack, Turborepo, i18next
- Architectural Patterns: FSD (Feature-Sliced Design), MVC, MVVM, MVP
- Unit and UI Testing (Vitest, React Testing Library, MSW), CI/CD, Git, Docker, UI/UX Design, RESTful API, Sentry, Amplitude

EXPERIENCE

Zypl.ai

Dushanbe, Dubai, Tashkent

A company reimagining financial services with synthetic AI agents.

Helps financial institutions make more accurate decisions.

■ Frontend Developer,

DEC 2022 — Present

Projects: [Lucid.AI \(B2B Platform\)](#), [aion.tj \(Consumer Lending Platform\)](#), [Pass ID \(Verido.ai\)](#), [Dynamic Scoring](#)

■ **Lucid.AI** — enterprise-grade MLOps platform

- Built the entire ML model lifecycle — from data upload to deployment — using Feature-Sliced Design with 51 feature modules and 14 pages.
- Implemented graph visualization of ML workflows (DAG) with @xyflow/react, featuring drag-and-drop, live updates over WebSocket and custom node types.
- Integrated the frontend with backend REST APIs, ensuring reliable data exchange and real-time updates.
- Introduced code splitting with automatic chunk recovery on deploy (lazyWithReload): 18 explicit chunk names, OXC minifier instead of Terser.
- Built a granular RBAC system based on the intersection of entities (MODEL, AGENT, ZGAN, RBAC) and actions (CREATE, VIEW, LOGIN) — protection both at the route level and at the component level via <Restricted>.
- Integrated Ed25519 signature verification into user authentication.
- Covered the codebase with 200+ spec files (Vitest + React Testing Library + MSW).
- **Stack:** React 19, TypeScript, Zustand, TanStack Query, TanStack Router, Vite, Tailwind CSS v4, SCSS Modules, @xyflow/react, Recharts, Chart.js, Apache Arrow, Parquet WASM, LangChain, LangGraph, Monaco Editor, React Hook Form, Zod, i18next, WebSocket, Axios.

■ **aion.tj (AION)** — online lending platform for Tajikistan

- Developed the full loan application user flow: from QR/SMS-OTP sign-up to passport verification (3 stages: front side → back side → selfie) with webcam capture, automatic image compression and submission to an OCR system.
- Implemented a multi-step application form with conditional routing based on document status, credit score and user profile — logic for filtering partner banks by underwriting results.
- Built a library of 32+ reusable UI components (modals, bottom sheets, skeletons, stepper, custom inputs).
- Set up Sentry error monitoring for the client/server/edge runtimes with source map uploads.
- Integrated Amplitude Analytics with the Session Replay Plugin to track the conversion funnel and user behaviour.

- **Stack:** Next.js 14 (App Router), React 18, TypeScript, SCSS Modules, Axios, Zod, Framer Motion, react-webcam, Amplitude, Sentry, Turborepo, Vitest.

■ **Pass ID (Verido.ai)** — *identity verification and document recognition*

- Developed a step-by-step identity verification interface (3 stages: passport front side → back side → selfie with passport) with navigation via React Router DOM v6 and token-based route protection.
- Implemented asynchronous image uploads with progress indicators, improving UX.
- Delivered a stable integration with the face and document recognition system, ensuring correct processing and display of the data on the frontend.
- Optimized rendering and introduced lazy loading, which noticeably improved interface responsiveness.
- Added bulk export of all three verification photos as a single archive via JSZip (base64 → ZIP → automatic download).
- Carried out cross-browser and cross-device testing, eliminating rendering inconsistencies on mobile browsers.
- **Stack:** React, TypeScript, Zustand, Axios, SCSS/SASS, Vite, React Camera Pro, JSZip, react-toastify, Docker, Git, Swagger, HTML.

■ **Dynamic Scoring** — *ML scoring interface for financial institutions*

- Built the interface for working with scoring models: parameter configuration, running calculations, results visualization and report export.
- Aligned requirements directly with stakeholders and translated Figma designs into component architecture.

Freelance

Krasnodar, Russia

■ Frontend Developer

Dec 2021 — May 2022

Projects: [Bozorchka](#)

- Worked closely with the project client to clarify business requirements, in particular with the accountant provided by the client, in order to digitize storage, inventory management and other accounting processes.
- Designed the entire platform, including a comprehensive statistics dashboard adapted for three user types. A separate interface was developed for each type, taking their tasks and needs into account.
- Implemented the frontend part of the application using React JS, Chart.js, Redux Toolkit, Axios and Ant Design, applying TypeScript to improve code reliability and development efficiency.
- Used the Git version control system for collaborative development, codebase management and efficient change tracking.

EDUCATION

Branch of the Russian State Hydrometeorological University, Tuapse

Major: Information Systems and Technologies (Engineer) · 2019 — 2023

LANGUAGES

Russian — fluent · Tajik — native · English — technical (documentation, correspondence)
